COVID-19 Australia: Epidemiology Report 47

Reporting period ending 1 August 2021

COVID-19 National Incident Room Surveillance Team
Surveillance summary

COVID-19 Australia: Epidemiology Report 47

Reporting period ending 1 August 2021

COVID-19 National Incident Room Surveillance Team

Summary

**Trends** – There has been an increase in the weekly number of new cases of COVID-19 since mid-June 2021. The daily average of 175 cases for this reporting period was more than double the previous fortnight’s daily average of 85 cases. There were 2,456 cases of COVID-19 this fortnight, bringing the 2021 cumulative case count to 5,680.

**Local cases** – There were 2,356 locally-acquired cases reported in Australia this fortnight, representing 96% (2,356/2,456) of cases overall. The majority of locally-acquired cases this fortnight were reported in New South Wales (92%; 2,159/2,356), followed by Victoria (6%; 145/2,356).

**Clusters and high-risk settings**

- The size of the Sydney Metropolitan Outbreak in New South Wales continued to increase this reporting period. The first case in this outbreak, reported on 16 June 2021, was a driver transporting international flight crew. Genomic test results showed that this case was infected with the Delta SARS-CoV-2 variant (B.1.617.2). As at 1 August 2021, New South Wales reported 3,634 locally-acquired cases since 16 June 2021. Several interstate-acquired cases have also been linked to this cluster, including 216 in Victoria, 21 in South Australia, six in Western Australia, and five in Queensland.

- All locally-acquired cases reported in Victoria in the reporting period were part of two community outbreaks: the Coolaroo Community Outbreak and Maribyrnong Community Outbreak. Almost all of these cases were detected in people already in quarantine. These outbreaks began following two seeding events of the Delta variant associated with travellers from New South Wales to Victoria. The first cases in the Coolaroo Community Outbreak, reported on 13 and 14 July 2021, were among a family of four that had returned from Greater Sydney on a red zone permit. As at 1 August 2021, there were 18 cases linked to this outbreak. The Maribyrnong Community Outbreak was first reported on 14 July 2021, with several cases linked to removalists from Greater Sydney. As at 1 August 2021, there were 196 cases, which were part of several interconnected outbreaks associated with the apartment complex initially visited by the removalists.

- Most locally-acquired cases reported in Queensland during the reporting period were part of an outbreak linked to a Brisbane high school. The first case in this outbreak was reported on 30 July 2021. The outbreak has been genomically linked to returned overseas travellers with the Delta variant. At the time of this report’s release, the epidemiological link was still under investigation. As at 1 August 2021, a total of 24 cases were linked to this outbreak: two overseas-acquired cases and 22 community cases.

- All locally-acquired cases reported in South Australia in the reporting period were part of the Modbury cluster. The first case in the cluster was reported on 19 July 2021, and was a person who...
returned from overseas. Whilst in hotel quarantine in New South Wales, the person spent 10 days in a Sydney hospital for an unrelated illness before returning to South Australia. The case became symptomatic in South Australia and got tested on 18 July 2021. The source of infection for this case was still under investigation at the time of this report’s release. Genomic testing confirmed that the person was infected with the Delta variant. As at 1 August 2021, there were 21 cases linked to this outbreak.

**Aboriginal and Torres Strait Islander persons** – During the reporting period, 15 new Aboriginal and Torres Strait Islander cases were notified, of which 14 were locally acquired from New South Wales and one was overseas acquired from Queensland. In 2021 to date, there were 32 cases reported in Aboriginal and Torres Strait Islander people.

**Overseas cases** – There were 91 overseas-acquired cases this reporting period, with the largest number of cases reported in Queensland (33%; 30/91), followed by New South Wales (25%; 23/91) and Western Australia (22%; 20/91).

**Severity** – Based on data from selected jurisdictions, from 1 January to 1 August 2021 the estimated proportion of cases hospitalised was 11.6% (592/5,095) and the proportion admitted to an intensive care unit (ICU) was 2.3% (117/5,095). In 2021, the case fatality rate for the year to date was 0.3% (16/5,680), with 11 new COVID-19-associated deaths notified during this reporting period.

**Vaccinations** – As at 1 August 2021, there have been 12,393,893 doses of COVID-19 vaccine administered in Australia.

Keywords: SARS-CoV-2; novel coronavirus; 2019-nCoV; coronavirus disease 2019; COVID-19; acute respiratory disease; epidemiology; Australia

This reporting period covers the two-week period 19 July – 1 August 2021, with data for this period compared to that from the previous two-week reporting period (5–18 July 2021).¹ The focus of this report is on the epidemiological situation in Australia since the beginning of 2021. Readers are encouraged to consult prior reports in this series for information on the epidemiology of cases in Australia in 2020.

Acute respiratory illness, testing, public health response measures, virology and the international situation are reported in detail on a four-weekly basis and are not included in this report. The latest information on these topics can be found in Epidemiology Report 46,¹ state and territory health websites,¹ the World Health Organization’s weekly situation reports,² and the Department of Health’s current situation and case numbers webpage.³

From report 46 onward, and unless otherwise specified, tabulated data and data within the text are extracted from the National Notifiable Diseases Surveillance System (NNDSS) based on ‘notification received date’ rather than ‘diagnosis date’ (see the Technical Supplement for definitions).² As a case’s diagnosis date can be several days prior to the date of its notification, there is potential for newly-notified cases to be excluded from the case count in the current reporting period when reporting by ‘diagnosis date’. Using ‘notification received date’ ensures that the case count for the reporting period

---

¹ https://www.who.int/emergencies/diseases/novel-coronavirus-2019/situation-reports/
better reflects the number of newly-notified cases. As the graphs presented in this report, based on NNDSS data, reflect a larger time period (i.e. year to date and entire pandemic), these will continue to be based on diagnosis date to enable a more accurate understanding of infection risk and local transmission.

Background and data sources

See the Technical Supplement for general information on COVID-19 including modes of transmission, common symptoms and severity.1

Activity

COVID-19 trends
(NNDSS and jurisdictional reporting to NIR)

This fortnight, there were more than double the number of cases reported in the previous fortnight. A total of 2,456 cases had a notification received date within this two-week reporting period (an average of 175 cases per day), compared to 1,192 cases (an average of 85 cases per day) in the previous reporting period. The majority of cases reported in the last 14 days occurred in New South Wales (89%; 2,190/2,456), followed by Victoria (6%; 153/2,456). The Australian Capital Territory and Tasmania did not report any cases during the reporting period (Table 1).

In the year to date, from 1 January 2021 to 1 August 2021, there have been 5,680 COVID-19 cases reported nationally. This year, until the week ending 20 June 2021, the number of weekly cases diagnosed remained below 180 cases per week (Figure 1). While there has been an increase in cases since mid-June 2021, cases in 2021 have remained low in contrast to the two distinct peaks experienced in March and July of 2020, when the number of weekly cases diagnosed reached approximately 2,700 and 3,000 respectively (Figure 2). Cumulatively, since the beginning of the epidemic in Australia, there have been 34,084 COVID-19 cases reported in Australia.

Source of acquisition
(NNDSS)

In this reporting period, 96% (2,356/2,456) of cases notified were locally acquired and 4% (91/2,456) were overseas acquired. At the end of the reporting period, there were nine cases under initial investigation, eight from New South Wales and one from Victoria (Table 1).

New South Wales reported the majority of locally-acquired cases (92%; 2,159/2,356) in this fortnight, followed by Victoria (6%; 145/2,356). In the reporting period, 66% (1,560/2,356) of locally-acquired cases had a known contact or link to a cluster, and 13 cases (12 in New South Wales and one in South Australia) had an unknown source. At the end of the reporting period, the source of infection was under ongoing investigation for 783 cases from New South Wales.

For 2021 to date, New South Wales had the highest infection rate for locally-acquired cases with 43.5 infections per 100,000 population, followed by Victoria with a rate of 5.5 infections per 100,000 population (Table 2). Based on cases notified up to 1 August 2021, both the Australian Capital Territory and Tasmania reported that it had been more than a year since the last locally-acquired case within either jurisdiction (Table 3).

Queensland reported the largest number of cases (33%; 30/91) that were overseas acquired, followed by New South Wales (25%; 23/91) and Western Australia (22%; 20/91). In the past 28 days (5 July to 1 August 2021), 38% (66/175) of overseas-acquired cases reported an unknown country of acquisition. Cases acquired at sea (23%; 25/109) were the most frequent of those with an identified country of acquisition in the past 28 days, followed by cases from India and the United Kingdom, each contributing to 10% of overseas cases (11/109) (Figure 7). The number of cases acquired in different countries is influenced by travel patterns of returning Australians, travel restrictions, and the prevalence of COVID-19 in the country of travel.

Demographic features

In this reporting period, the largest proportion of cases occurred in those aged 20 to 29 years (21%; 523/2,456). For this year, the highest rate of infection was in those aged 20 to 29 years with a rate of 33.0 infections per 100,000 population (Figure 3; Appendix A, Table A.1). Adults aged 70 to 79 years had the lowest rate of infection this year.

In 2021, notification rates were higher in males than in females for all age groups except those aged 80 to 89 years (Figure 3). The largest proportional difference by sex, in rates this year, was in the 60 to 69 years age group, where the cumulative rate among males was 16.1 cases per 100,000 population and among females was 10.0 cases per 100,000 population (Appendix A, Table A.1). The median age of cases in this reporting period was 31 years (range: 0 to 96 years; interquartile range, IQR: 20 to 48 years).

Aboriginal and Torres Strait Islander persons

Since the beginning of 2021, there have been 32 confirmed cases of COVID-19 notified in Aboriginal and Torres Strait Islander people, representing 0.6% (32/5,680) of all confirmed cases this year. During the reporting period, 15 new Aboriginal and Torres Strait Islander cases were notified, of which 14 were locally acquired from New South Wales and one was overseas acquired from Queensland.

As at 1 August 2021, it has been one day since the last locally-acquired Aboriginal and Torres Strait Islander case was diagnosed and 15 days since the last overseas-acquired Aboriginal and Torres Strait Islander case was diagnosed.

b This does not include locally-acquired cases that were interstate acquired.
c NA: not applicable. The Northern Territory has not reported any locally-acquired cases with an unknown source of infection.
The majority of Aboriginal and Torres Strait Islander cases in 2021 have been reported as locally acquired (84%; 27/32), with five cases overseas acquired. The median age of all Aboriginal and Torres Strait Islander cases this year is 25 years old (range: 2 to 66 years; IQR: 13 to 45 years) and the distribution of cases between males and females is equal, with 16 cases each.

Vaccinations
(Department of Health)

As of 1 August 2021, a total of 12,393,893 doses of COVID-19 vaccine had been administered (Table 4), including 524,237 doses provided to aged care and disability residents.

Clusters and outbreaks

**Sydney Metropolitan Outbreak**

The size of the Sydney Metropolitan Outbreak in NSW continued to increase this reporting fortnight, with 2,159 cases reported to NNDSS. The first case in the cluster, reported on 16 June 2021, was a driver transporting international flight crew. Genomic testing results showed that this case was infected with the Delta SARS-CoV-2 variant of concern (B.1.617.2); however, the sequence did not match cases from the Victorian Delta variant outbreak that occurred from May to June 2021. This sequence had not been seen in Australia previously, but matched one from the United States of America.

Up to 1 August 2021, in New South Wales there have been 3,634 locally-acquired cases, including 14 deaths, reported since 16 June 2021. Several interstate-acquired cases have also been linked to this outbreak, including 216 in Victoria, 21 in South Australia, six in Western Australia and five in Queensland.

**Victoria**

All locally-acquired cases reported in Victoria in the reporting period were part of two community outbreaks: the Coolaroo Community Outbreak and Maribyrnong Community Outbreak. Almost all of these cases were detected in people already in quarantine. These outbreaks began following two seeding events of the Delta variant associated with travellers from New South Wales to Victoria.

The first cases in the Coolaroo Community Outbreak, reported on 13 and 14 July 2021, were among a family of four that had returned from Greater Sydney on a red zone permit. As at 1 August 2021, there were 18 cases linked to this outbreak.

The Maribyrnong Community Outbreak was first reported on 14 July 2021, with several cases linked to removalists from Greater Sydney who delivered furniture to an apartment in western Melbourne on 8 July 2021. As at 1 August 2021, there were 196 cases linked to this outbreak. These cases were part of several interconnected outbreaks associated with the apartment complex initially visited by the removalists.

**Queensland**

Most locally-acquired cases reported in Queensland during the reporting period were part of an outbreak linked to a Brisbane high school. The first case in this outbreak was reported on 30 July 2021. The outbreak has been genomically linked to returned overseas travellers with the Delta variant. The epidemiological link is still being investigated. As at 1 August 2021, a total of 24 cases were linked to this outbreak: two overseas-acquired cases and 22 community cases.

**South Australia**

All locally-acquired cases reported in South Australia in the reporting period were part of the Modbury cluster. The first case in this cluster was reported on 19 July 2021, and was a person who returned from overseas. Whilst in hotel quarantine in New South Wales, the person spent 10 days in a Sydney hospital for an unrelated illness before returning to South Australia. The case became symptomatic in South Australia and presented to an Adelaide hospital and got tested on 18 July 2021. The source of infection for this case is still under investigation. Genomic testing confirmed that the person was infected with the Delta variant. As at 1 August 2021, there were 21 cases linked to this outbreak.

\textsuperscript{a} Source: NNDSS, extract from 3 August 2021, based on notification received date.
\textsuperscript{b} Data included from six jurisdictions with the most reliable data across both hospital and ICU data fields: Australian Capital Territory, New South Wales, South Australia, Tasmania, Victoria and Western Australia. This is based on an assessment of data from SPRINT-SARI and NNDSS.

Severity
\textit{(NNDSS, FluCAN, SPRINT-SARI)}

Hospitalisation and intensive care unit admission

In 2021, for cases where hospitalisation and intensive care unit (ICU) data were reliable and complete, the estimated hospitalisation rate was 11.6% of cases, and the estimated ICU admission rate was 2.3% of cases (Table 5). This is based on data from six states/territories that have reliable data across both hospitalisation and ICU data fields in the NNDSS, and who do not routinely hospitalise cases for isolation purposes (Australian Capital Territory, New South Wales, South Australia, Tasmania, Victoria and Western Australia).

In the year to date to 1 August 2021, there have been 171 COVID-19 cases admitted to ICUs participating in the sentinel surveillance system, Short Period Incidence Study of Severe Acute Respiratory Infection (SPRINT-SARI),\textsuperscript{4} with 90 of these admitted during this reporting period (19 July – 1 August 2021).

Risk factors for severe disease

The hospitalisation rate for COVID-19 cases in the year to date has increased with advancing 10-year age bracket (Table 5).

Comorbidity data extracted from SPRINT-SARI reflect the sickest patients with COVID-19 managed in ICU; data are therefore not generalisable to all cases (Table 6). In patients admitted to ICU with COVID-19 since 1 February 2021, the most prevalent comorbidity was diabetes, following by obesity (a body mass index of > 30 or weight over 120 kg). Of those adult patients admitted to ICU this year for whom comorbidity data was known, 55% (85/154) had at least one comorbidity; 45% (69/154) of patients had none of the listed comorbidities recorded.

<sup>d</sup> Excludes cases where comorbidity data is missing or unknown for all comorbidities.

COVID-19 deaths

In the reporting fortnight, there were 11 deaths associated with COVID-19, all from New South Wales. The overall crude case fatality rate (CFR) since the start of the epidemic was 2.71% (Table 7). The ratio of deaths to cases in the year to date has decreased in comparison to this time last year, noting substantially lower case numbers this year and the difference in age distributions of those infected in 2021 versus 2020.
